# Metropolis algorithm on path graph (1/5)

- Path graph  $\mathcal{P}_n$  so that  $\Omega_n = \{1, \dots, n\}$ .
- **Phantom vertices and edges.**

Metropolis algorithm (NB:  $P_{ij} = \mathcal{A}_{ij}P_{ij}$  for  $i \neq j$ ):

- 1 Move set  $\mathcal{L} = \{+, -\}$ .
- 2  $\mathcal{A}$  flat  $\rightarrow \sigma = \text{choice}(\mathcal{L})$ .
- 3 Metropolis filter: Accept with probability  $\min(1, \pi_j/\pi_i)$ .

# Metropolis algorithm on path graph (2/5)

- Detailed balance:

$$\underbrace{\pi_i P_{ij}}_{\mathcal{F}_{ij}} = \underbrace{\pi_j P_{ji}}_{\mathcal{F}_{ji}}$$

- Metropolis **algorithm**:

$$\mathcal{F}_{ij} = \frac{1}{2} \min(\pi_i, \pi_j) \Leftrightarrow P_{ij} = \frac{1}{2} \min(1, \pi_j/\pi_i)$$

- Metropolis **filter** (NB:  $P_{ij} = \mathcal{A}_{ij} \mathcal{P}_{ij}$ ):

$$\mathcal{P}_{ij} = \min(1, \pi_j/\pi_i)$$

# Metropolis algorithm on path graph (3/5)

- Global balance ( $\pi_i = \sum_j \pi_j P_{ji} = \sum_j \mathcal{F}_{ji}$ ):

$$\underbrace{\pi_i - \frac{1}{2} \min(\pi_i, \pi_{i-1}) - \frac{1}{2} \min(\pi_i, \pi_{i+1})}_{\text{curved arrow}}$$

$i-1$	$\xrightarrow{\frac{1}{2} \min(\pi_{i-1}, \pi_i)}$ $\xleftarrow{\frac{1}{2} \min(\pi_i, \pi_{i-1})}$	$i$	$\xrightarrow{\frac{1}{2} \min(\pi_i, \pi_{i+1})}$ $\xleftarrow{\frac{1}{2} \min(\pi_{i+1}, \pi_i)}$	$i+1$
-------	---	-----	---	-------

- Irreducibility **OK** if no holes in  $\pi$ .
- Aperiodicity **OK, thanks to boundaries**

# Metropolis algorithm on path graph (4/5)

```
procedure metro-path
input  $x$ 
 $\sigma \leftarrow \text{choice}(\mathcal{L})$  ( $\mathcal{L} = \{-1, +1\}$ )
if ( $\text{ran}(0, 1) < \pi_{x+\sigma}/\pi_x$ ) then
    {  $x_i \leftarrow x_i + \sigma$  }
output  $x$ 
```

---

# Metropolis algorithm on path graph (5/5)

Model	Definition	Conductance	$t_{\text{mix}}$
Flat	$\pi_i = \frac{1}{n}$	$\mathcal{O}(1/n)$	$\mathcal{O}(n^2)$
Square	$\pi_{2k-1} = \frac{2}{3n}, \pi_{2k} = \frac{4}{3n}$	$\sim 2/(3n)$	$\mathcal{O}(n^2)$
V-shape	$\pi_i = \frac{4}{n^2} \left  \frac{n+1}{2} - i \right $	$\sim 2/n^2$	$\mathcal{O}(n^2 \log n)$

NB: Graph diameter  $n$ .

NNB:  $\pi$  normalized.

NNNB: Bottleneck between  $i = \frac{n}{2}$  and  $j = \frac{n}{2} + 1$ .

# Lifting on the path graph (1/7)

Probability distribution  $\pi = (1/n, \dots, 1/n)$  (Diaconis et al. 2000)

- “Collapsed” Markov chain:

- “Lifted” Markov chain  $\hat{\Omega} = \Omega \times \{-, +\}$ :

- Irreducible, but not aperiodic.  $\hat{\pi}_{i,\sigma} = \frac{1}{2}\pi_i = 1/(2n)$

# Lifting on the path graph (2/7)

Probability distribution  $\pi = (1/n, \dots, 1/n)$  (Diaconis et al. 2000)

- Transport + **resampling**

- “Lifted” Markov chain  $\hat{\Omega} = \Omega \times \{-, +\}$ :

# Lifting on the path graph (3/7)

728

P. DIACONIS, S. HOLMES AND R. M. NEAL

The transition matrix is doubly stochastic, and thus the stationary distribution is uniform.

- Diaconis, Holmes, Neal (2000).
- $\Omega$  (samples) +  $\mathcal{L}$  (moves)  $\rightarrow \hat{\Omega} = \Omega \times \mathcal{L}$  (lifted samples)
- Resampling with rate  $1/n$ .
- **Phantoms** illustrate the “rejection  $\rightarrow$  lifting” mystery.
- Let's generalize.

# Lifting on the path graph (4/7)

General probability distribution  $\pi = (\pi_1, \dots, \pi_n)$

- “Collapsed” Markov chain:

- “Lifted” Markov chain  $\hat{\Omega} = \Omega \times \{-, +\}$ :

- Replace all rejections by lifting moves.

# Lifting on the path graph (5/7)

- “Lifted Markov chain: **Transport**”

NB: The  $\frac{1}{2} \Leftrightarrow \hat{\pi}_{i,\sigma} = \frac{1}{2} \pi_i$

- “Lifted Markov chain: **Resampling**”

- Resampling ensures aperiodicity for any  $\pi$

# Lifting on the path graph (6/7)

- Transport

```
procedure transport-path
input  $\{x, \sigma\}$  (configuration  $\in \hat{\Omega} = \Omega \times \{+, -\}$ )
if ( $\text{ran}(0, 1) < \pi_{x+\sigma}/\pi_x$ ) then
   $\{ x_i \leftarrow x_i + \sigma$ 
else
   $\{ \sigma \leftarrow -\sigma$ 
output  $\{x, \sigma\}$ 
```

---

- Resampling

```
procedure resample-path
input  $\{x, \sigma\}$  (configuration  $\in \hat{\Omega} = \Omega \times \{+, -\}$ )
if ( $\text{ran}(0, 1) < p$ ) then ( $p$ : resampling rate)
   $\{ \sigma \leftarrow -\sigma$ 
output  $\{x, \sigma\}$ 
```

---

- Mix freely!

# Lifting on the path graph (7/7)

Model	Conductance	$t_{\text{mix}}$ (collapsed)	$t_{\text{mix}}$ (lifted)
Flat	$\mathcal{O}(1/n)$	$\mathcal{O}(n^2)$	$\mathcal{O}(n)$
Square	$\mathcal{O}(1/n)$	$\mathcal{O}(n^2)$	$\mathcal{O}(n^2)$
V-shape	$\mathcal{O}(1/n^2)$	$\mathcal{O}(n^2 \log n)$	$\mathcal{O}(n^2)$
